

Halliburton is an oil field service company that I closely follow for years.

Between 22-06-2012 and 23-07-2014, holders of the stock have gained 176% profit.

According to the simple linear regression model that I have implemented; with a standard error of 3.02, the formula is $y = 27.53 + 0.071x$.

This shows a daily return of 7 cents for 523 trading days between the data range.
